## What is claimed is:

- 1. Apparatus for generating video images on a
   2 display device arranged in accordance with a digital video
   3 standard comprising, in combination:
  - a) a processor for generating a plurality of digital electrical signals in accordance with said predetermined video standard, said plurality of digital electrical signals including a first transmission protocol signal;
  - b) a first connector, including a plurality of pins, for receiving and directing each of said digital electrical signals to a predetermined pin and for receiving a second digital electrical transmission protocol signal at a predetermined pin;
  - c) a second connector including a plurality of pins arranged to receive each of said digital electrical signals, direct each of said signals to a predetermined portion of a port of said display device and to receive said second digital electrical transmission protocol signal from said port of said display device and direct said transmission protocol signal to a predetermined pin of said second connector;
  - d) an electrical-to-optical converter circuit for receiving said digital electrical signals and generating a plurality of digital optical signals in

25 response thereto and for receiving a digital optical 26 signal and generating said second digital electrical transmission protocol signal in response thereto; 27 28 e) an optical-to-electrical converter circuit 29 for receiving a plurality of digital optical signals and 30 converting said signals to said plurality of digital electrical signals and for converting said second digital 31 32 electrical transmission protocol signal to a digital 33 optical signal; f) an optical cable in optical communication 34 35 with said electrical-to-optical converter and said optical-to-electrical converter; and 36 37 g) said optical cable including a single optical fiber for transmitting said optical signals between said 38 electrical-to-optical converter and said optical-to-39 40 electrical converter.

2. Apparatus as defined in Claim 1 wherein said 1 electrical-to-optical converter circuit further includes: 2 a) a first branch for receiving a digital 3 optical signal and converting said signal to said second 4 digital electrical transmission protocol signal; 5 b) a second branch for receiving said first 6 7 digital electrical transmission protocol signal and an electrical transmission protocol clock signal and for 8 converting said signals to a single digital optical signal; and 10 c) a directional logic circuit in communication 11 with said first connector and with said first and second 12 branches for preventing retransmission of said second 13 digital electrical transmission protocol signal onto said 14 optical cable. 15 1 2 second branch of said electrical-to-optical circuit

- 3. Apparatus as defined in Claim 2 wherein said further includes: 3
- a) a light source; and 4

5

6

- b) said light source being controlled by the output of a logic gate; and
- c) the inputs to said logic gate being said first transmission protocol signal and the inverse of said second transmission protocol signal.

- 4. Apparatus as defined in Claim 3 wherein said logic gate comprises an EXCLUSIVE OR gate.
- 5. Apparatus as defined in Claim 2 wherein said directional logic circuit includes:
- a) a first node for receiving said second
   transmission protocol signal;
- b) a second node for receiving said first
   transmission protocol signal and the inverse of said
   second transmission protocol signal; and
- c) a third node for receiving the inverse of said second transmission protocol signal.
- 6. Apparatus as defined in Claim 5 wherein the inputs to said EXCLUSIVE OR gate comprise the voltage potentials at said second and third nodes.
- 7. Apparatus as defined in Claim 1 wherein said plurality of electrical signals additionally comprise red, blue and green information.
- 8. Apparatus as defined in Claim 1 wherein said plurality of electrical signals additional comprises a pixel clock.

- 9. Apparatus as defined in Claim 1 wherein said optical-to-electrical converter circuit further includes:
- a) a first branch for receiving a digital

  optical signal and converting said signal to said first

  digital electrical transmission protocol signal and to an

  electrical transmission protocol clock;
  - b) a second branch for receiving said second digital electrical transmission protocol signal and converting said signal to a digital optical signal; and

c) a directional logic circuit in communication with said second connector and with said first and second branches for preventing retransmission of said first digital electrical transmission protocol signal onto said optical cable.

- 1 10. Apparatus as defined in Claim 9 wherein
  2 said second branch of said electrical-to-optical circuit
  3 further includes:
  4 a) a light source; and
- b) said light source being controlled by theoutput of a logic gate; and
- c) the inputs to said logic gate being said
  second transmission protocol signal and the inverse of
  said first digital electrical transmission protocol
  signal.
- 1 11. Apparatus as defined in Claim 10 wherein 2 said logic gate comprises an EXCLUSIVE OR gate.
- 1 12. Apparatus as defined in Claim 9 wherein 2 said directional logic circuit includes:
- a) a first node for receiving said firsttransmission protocol signal;
- b) a second node for receiving said second
  digital electrical transmission protocol signal and the
  inverse of said first digital electrical transmission
  protocol signal; and
- c) a third node for receiving the inverse of said first digital electrical transmission protocol signal.

- 13. Apparatus as defined in Claim 12 wherein
  the inputs to said EXCLUSIVE OR gate comprise the voltage
  potentials at said second and third nodes.
  - 1 14. Apparatus as defined in Claim 1 further characterized in that:
  - a) said plurality of digital electrical signals
     generated by said processor includes an electrical
     transmission protocol clock signal; and
- b) said electrical-to-optical converter circuit
  includes an electrical multiplexer for serially combining
  said first electrical transmission protocol digital
  electrical signal and said electrical transmission
  protocol clock signal.
- 15. Apparatus as defined in Claim 14 further
  including a light source, said light source being
  responsive to said serially combined first electrical
  transmission protocol signal and said electrical
  transmission protocol clock signal to output a first
  digital optical transmission protocol signal.

16. Apparatus as defined in Claim 2 wherein
2 said optical-to-electrical converter circuit further
3 includes:
4 a) a photodetector for converting said first

5

8

9.

10

11

12

a) a photodetector for converting said first digital optical transmission protocol signal to a serial combination of said first digital electrical transmission protocol signal and said electrical transmission protocol clock signal; and

b) an electrical demultiplexer for separating said serial combination into said first digital electrical transmission protocol signal and said electrical transmission protocol clock signal.

	1	17. Apparatus as defined in Claim I wherein
	2	said electrical-to-optical converter circuit is further
	3	characterized in that:
	4	a) said plurality of digital electrical signals
	5	includes a plurality of digital electrical video signals;
	6	b) each of said digital electrical video signals
	7	is arranged to modulate the output of one of a
•	8	corresponding plurality of light sources;
	9.	c) each of said corresponding plurality of light
1	10	sources is arranged to emit light of a different center
. 1	11	wavelength;
1	L2	d) said center wavelengths of said corresponding
1	13	plurality of light sources defining a frequency band; and
	L4	e) the center frequency of said light source for
, .	15	outputting said first transmission digital optical
	16	transmission protocol signal is outside said frequency
:	17	band.

1	18. Apparatus as defined in Claim 1 wherein
2	said optical-to-electrical converter circuit further
3	includes:
4 ,	a) a light source, said light source being
5	responsive to said second electrical transmission protocol
6	signal to output a second digital optical transmission
7	protocol signal; and
8	b) said light source is arranged to output light
9	of the same center frequency as said light for outputting
10	a first digital optical transmission protocol signal.

1 19. Apparatus as defined in Claim 18 wherein 2 said electrical-to-optical converter circuit further includes:

a) an optical multiplexer;

- b) said optical multiplexer being arranged to receive said plurality of digital optical video signals from said plurality of light sources of said frequency band, said first digital optical transmission protocol signal from said light source outside said frequency band and said second digital optical transmission protocol signal from said optical cable;
- c) said optical multiplexer providing a single optical signal onto said optical cable that comprises said plurality of digital optical video signals and said first digital optical transmission protocol signal; and
- d) said optical multiplexer providing said second digital optical transmission protocol signal to a photodetector for generating said second digital electrical transmission protocol signal.

20. Apparatus as defined in Claim 18 wherein
said optical-to-electrical converter circuit further
includes:

a) an optical demultiplexer;
b) said optical demultiplexer being arranged to
receive said second digital optical transmission protocol
signal and an optical signal that includes said plurality
of digital optical video signals and said first digital

optical transmission protocol signal from said optical
 cable;

- c) said optical demultiplexer providing said second digital optical transmission protocol signal onto said optical cable and said plurality of optical video signals to a plurality of photodetectors for generating said plurality of digital electrical video signals; and
- d) said optical demultiplexer providing said first digital optical transmission protocol signal to a photodetector for generating said serially combined first digital electrical transmission protocol signal and electrical transmission protocol clock signal.

Apparatus for communication of a bidirectional digital electrical signal, comprising sequential forward and reverse transmissions, between a bidirectional port of a first device and a bidirectional port of a second device, and an associated electrical clock signal between a clock port of said first device and a clock port of said second device, said first and second devices being remote from one another, said apparatus comprising, in combination: 

25 .

- a) an electrical-to-optical converter circuit for receiving a forward digital electrical signal and said electrical clock signal and generating a forward digital optical signal in response thereto and for receiving a reverse digital optical signal and generating a reverse digital electrical signal in response thereto;
- b) an optical-to-electrical converter circuit for receiving said forward digital optical signal and converting said signal to said forward digital electrical signal and said electrical clock signal and for converting said reverse digital electrical signal to said reverse digital optical signal;
- c) an optical cable in optical communication with said electrical-to-optical converter and said optical-to-electrical converter; and
  - d) said optical cable comprising a single

optical fiber for transmitting said optical signals
between said electrical-to-optical converter and said
optical-to-electrical converter.

- 22. Apparatus as defined in Claim 21 wherein said electrical-to-optical converter circuit further includes:
  - a) a first branch for receiving said reverse digital optical signal and converting said signal to said reverse digital electrical signal;
    - b) a second branch for receiving said forward digital electrical signal and said electrical clock signal and converting said signals to said forward digital optical signal; and
  - c) a directional logic circuit in communication with said first connector and with said first and second branches for preventing retransmission of said reverse digital electrical transmission signal onto said optical cable.

1	23. Apparatus as defined in Claim 22 wherein
2 .	said second branch of said electrical-to-optical circuit
3	further includes:
4	a) a light source; and
5	b) said light source being controlled by the
6	output of a logic gate; and
7	c) the inputs to said logic gate being said
8	forward digital electrical signal and the inverse of said
9	reverse digital electrical signal.
1	24. Apparatus as defined in Claim 23 wherein
2	said logic gate comprises an EXCLUSIVE OR gate.
1	25. Apparatus as defined in Claim 24 wherein
2	said directional logic circuit includes:
3	a) a first node for receiving said reverse
4	digital electrical signal;
່ 5	b) a second node for receiving said forward
6	digital electrical signal and the inverse of said reverse
7	digital electrical signal; and

said reverse digital electrical signal.

c) a third node for receiving the inverse of

- 26. Apparatus as defined in Claim 25 wherein the inputs to said EXCLUSIVE OR gate comprise the values at said second and third nodes.
- 27. Apparatus as defined in Claim 21 wherein said optical-to-electrical converter circuit further includes:
- a) a first branch for receiving said forward
  digital optical signal and converting said signal to said
  forward digital electrical signal and said electrical
  clock signal;
  - b) a second branch for receiving said reverse digital electrical signal and converting said signal to said reverse digital optical signal; and

8

9

10

c) a directional logic circuit in communication
with said second connector and with said first and second
branches for preventing retransmission of said forward
digital electrical signal onto said optical cable.

28. Apparatus as defined in Claim 27 wherein 1 said second branch of said electrical-to-optical circuit 2 further includes: 3 a) a light source; and 4 5 b) said light source being controlled by the output of a logic gate; and 6 c) the inputs to said logic gate being said 7 reverse digital electrical signal and the inverse of said forward digital electrical signal.

- 29. Apparatus as defined in Claim 28 wherein said logic gate comprises an EXCLUSIVE OR gate.
- 30. Apparatus as defined in Claim 29 wherein said directional logic circuit includes:
- a) a first node for receiving said forwarddigital electrical signal;
- b) a second node for receiving said reverse
  digital electrical signal and the inverse of said forward
  digital electrical signal; and
- c) a third node for receiving the inverse of said forward digital electrical signal.

- 31. Apparatus as defined in Claim 30 wherein
  the inputs to said EXCLUSIVE OR gate comprise the voltage
  potentials at said second and third nodes.
- 32. Apparatus as defined in Claim 21 wherein said electrical-to-optical converter circuit further includes an electrical multiplexer for serially combining said forward digital electrical signal and said electrical clock signal.
- 33. Apparatus as defined in Claim 32 further including a light source, said light source being responsive to said serially combined signal to output said forward digital optical signal.

1 34. Apparatus as defined in Claim 21 wherein 2 said optical-to-electrical converter circuit further includes: 3 4 a) a photodetector for converting said forward digital optical signal to an electrical signal comprising 5 a serial combination of said forward digital electrical 6 7 signal and said electrical clock signal; and 8 b) an electrical demultiplexer for separating 9 said electrical signal comprising a serial combination of 10 said forward digital electrical signal and said electrical 11 clock signal into said forward digital electrical signal

and said electrical clock signal.
